

Simple Guide to Lynch Syndrome: Diagnosis, Treatment, and Related Conditions

Lynch Syndrome is a hereditary cancer syndrome that increases your risk of developing certain types of cancer, including colon cancer, endometrial cancer, ovarian cancer, stomach cancer, and colorectal cancer.

Lynch Syndrome is caused by a mutation in one of the DNA mismatch repair (MMR) genes. MMR genes help to correct errors that occur when DNA is copied during cell division. When MMR genes are mutated, errors in DNA replication can accumulate, leading to the development of cancer.
